Classification

Agency

ISO 9001:2015

Designed, manufactured and/or distributed under this quality management system

\* Footnotes

| Operating Frequency Band                                      | Bands correspond with CCIR recommendations or common allocations used throughout the world. Other ranges can be accommodated on special order.  |
|---|---|
| Gain, Mid Band  | For a given frequency band, gain is primarily a function of<br>antenna size. The gain of Andrew antennas is determined by<br>either gain by comparison or by computer integration of the<br>measured antenna patterns.  |
| Boresite Cross Polarization Discrimination (XPD)              | The difference between the peak of the co-polarized main<br>beam and the maximum cross-polarized signal over an angle<br>twice the 3 dB beamwidth of the co-polarized main beam.  |
| Front-to-Back Ratio   | Denotes highest radiation relative to the main beam, at 180° ±40°, across the band. Production antennas do not exceed rated values by more than 2 dB unless stated otherwise.   |
| Return Loss   | The figure that indicates the proportion of radio waves incident upon the antenna that are rejected as a ratio of those that are accepted.  |
| VSWR  | Maximum; is the guaranteed Peak Voltage-Standing-Wave-<br>Ratio within the operating band.  |
| Radiation Pattern Envelope Reference (RPE)                    | Radiation patterns define an antenna's ability to discriminate<br>against unwanted signals. Under still dry conditions,<br>production antennas will not have any peak exceeding the<br>current RPE by more than 3dB, maintaining an angular<br>accuracy of +/-1° throughout |
| Cross Polarization Discrimination (XPD) Electrical Compliance | The difference between the peak of the co-polarized main<br>beam and the maximum cross-polarized signal over an angle<br>twice the 3 dB beamwidth of the co-polarized main beam.  |
| Wind Speed, operational                                       | For VHLP(X), SHP(X), HX and USX antennas, the wind speed where the maximum antenna deflection is $0.3 \times 10^{-3} \text{ dB}$ beam width of the antenna. For other antennas, it is defined as a deflection is equal to or less than 0.1 degrees.                         |
| Wind Speed, survival  | The maximum wind speed the antenna, including mounts<br>and radomes, where applicable, will withstand without<br>permanent deformation. Realignment may be required. This<br>wind speed is applicable to antenna with the specified<br>amount of radial ice.                |

**COMMSCOPE**°

| Axial Force (FA)     | Maximum forces exerted on a supporting structure as a result of wind from the most critical direction for this parameter. The individual maximums specified may not occur simultaneously. All forces are referenced to the mounting pipe.             |
|----------------------|---|
| Side Force (FS)      | Maximum side force exerted on the mounting pipe as a<br>result of wind from the most critical direction for this<br>parameter. The individual maximums specified may not<br>occur simultaneously. All forces are referenced to the<br>mounting pipe.  |
| Twisting Moment (MT) | Maximum forces exerted on a supporting structure as a<br>result of wind from the most critical direction for this<br>parameter. The individual maximums specified may not<br>occur simultaneously. All forces are referenced to the<br>mounting pipe. |
| Packaging Type       | Andrew standard packing is suitable for export. Antennas are<br>shipped as standard in totally recyclable cardboard or wire-<br>bound crates (dependent on product). For your convenience,<br>Andrew offers heavy duty export packing options.        |
